

What are batteries & how do they work?

Batteries are stores of chemical energy that can be converted to electrical energy and used as a power source. In this article you can learn about: This resource is suitable for energy and sustainability topics for primary school learners. In this video, learn about different types of batteries and how they work.

How does a battery convert chemical energy to electrical energy?

In simple terms, a battery stores potential energy and releases it as electrical energy when needed. But the storage happens at a chemical level, where energy is locked inside the chemical bonds of substances within the battery. The conversion from chemical to electrical energy allows us to use batteries for various applications.

1.

How do batteries store energy?

Batteries are used to store chemical energy. Placing a battery in a circuit allows this chemical energy to generate electricity which can power device like mobile phones, TV remotes and even cars. Generally, batteries only store small amounts of energy. More and more mobile devices like tablets, phones and laptops use rechargeable batteries.

Why do batteries use chemical energy?

The reason batteries store energy in the form of chemical energy boils down to efficiency and practicality. Chemical reactions are a stable way to store energy, especially in a compact form. Batteries use chemical energy because: High Energy Density: Chemical bonds store significant amounts of energy relative to their size.

Why do we need batteries?

Batteries store energy which means we can reduce waste of energy. This can help us to reduce the amount of non-renewable energy we use and therefore helps the environment. Many batteries are easy to remove and replace or recharge. Many batteries are small and portable, so they can provide electricity for mobile devices and vehicles.

What is a battery used for?

Batteries can be used to power portable devices. They let devices use electricity without the need to be plugged into main electricity sources, such as wall sockets. Mobile phones, tablets, the TV remote and torches all use batteries. Some batteries are rechargeable so they can be used again and again.

Renewable Energy Storage: These batteries serve as stable storage solutions for solar and wind energy, supporting sustainable energy systems.
