## **Battery conversion to mobile power**

Why do portable batteries need a buck conversion?

In order to maintain battery life,portable applications require both high conversion efficiency and low standby power dissipation. Multi-cell battery packs may require step-down (buck) conversions and single cell batteries often require step-up (boost) conversions to maintain consistent power levels while the batteries discharge.

What are portable power conversion applications?

Portable power conversion applications present unique and challenging design considerations. Innovative, small electronics require solutions with small footprints. In order to maintain battery life, portable applications require both high conversion efficiency and low standby power dissipation.

How do you calculate watt-hours in a battery?

Wh is calculated from the voltage (V) provided by a battery, multiplied by the current (amps) supplied by a battery for a certain time (usually in hours). Generally, we use mAh for cells and batteries, whereas watt-hours for energy storage systems.

Are old mobile phone batteries still useful?

Most old mobile batteries are still very usableeven if they don't seem to last very long in power hungry mobile phones. The other great thing about using old mobile phone batteries is you can get them for free! There are plenty of places that have mobile phone recycling bins where you can score a few batteries, free of charge.

What is a power conversion station (PCS)?

PCS is a fully functional power conversion station for utility-scale battery energy storage systems(up to 1500 VDC). It is optimized for BESS integration into complex electrical grids and is based on the same best-in-class power conversion platform as our AMPS and PVI solutions, enabling greater scalability and efficiency.
