

Which welding methods can be used for battery assembly?

Other joining methods such as micro-tungsten-inert-gas welding (micro-TIG), micro-clinching, soldering, and magnetic-pulse welding exist and have been proposed for battery assembly applications, but they are not well established, and therefore their feasibility is still being evaluated, or they are not widely used in the industry.

Are cold plates a good solution for battery thermal management?

The hydraulic and heat transfer performance of laminar and turbulent topology-optimized cold plates has been compared with traditional cold plates. Liquid cooling with cold plates offers an efficient solution for battery thermal management.

How do cold plates affect the temperature of battery packs?

The average and maximum temperatures of battery packs with various inlet mass flow rates using different cold plates are plotted in Fig. 18. Generally, for all the cold plates, a higher flow rate, i.e., enhanced convection between the coolant and the batteries, leads to a decrease in both average and maximum temperatures.

What is mechanical fastening in battery pack assembly?

Mechanical fastening is another method of joining electrical components in the BEV's powertrain, but in the context of battery pack assembly, it is mainly used for the assembly of modules. The following paragraphs provide some brief but informative descriptions of each of the four most commonly used welding methods for battery module assembly.

Does a liquid cooling battery pack use cold plates?

This paper investigates the thermal performance of a liquid cooling lithium ion battery pack that uses cold plates through simulation. The three dimensional CFD model of the battery pack was established with the goal of reducing the maximum temperature and temperature difference of the battery pack.

How are battery cells welded?

Different welding processes are used depending on the design and requirements of each battery pack or module. Joints are also made to join the internal anode and cathode foils of battery cells, with ultrasonic welding (UW) being the preferred method for pouch cells.

If anything it is perhaps a bit too hot and since it is only on instantaneously, you can make loads of joints (100+) before the battery runs flat. The cold heat soldering iron works ...
