

Should a fuse be connected to a negative battery terminal?

Connect two fuses, one at the positive and one at the negative battery terminals. Also, during my research, I came across a post that advised to connect a fuse at the positive terminal since it would protect both circuit and the battery, but if the fuse is connected to the negative battery terminal, then it only protects the battery. Is this true?

How do you connect a battery fuse?

Connect the fuse to the negative terminal of the battery since it's where the actual flow of electrons originates which is opposite to the conventional flow of current from the positive terminal. Connect the fuse to the positive terminal. Connect two fuses, one at the positive and one at the negative battery terminals.

Where should a battery fuse be placed?

Recommended practice is to place the fuse near the positive terminal of the battery, so the whole circuit will be dead if the fuse blows. (Of course, if the positive terminal is considered Ground, place the fuse near the negative terminal.) What if the battery was reversed on accident, do you think the other fuse would provide protection?

What happens if a battery fuse blows?

Since the negative terminal of the battery is normally considered "Ground" or "Zero Volts", a fuse in the negative lead would leave the rest of the circuit "hot" - usually Not a Good Thing. Recommended practice is to place the fuse near the positive terminal of the battery, so the whole circuit will be dead if the fuse blows.

What happens if you put a fuse in a negative lead?

Don't worry about electrons, just think of it as charge moving from + to -. Since the negative terminal of the battery is normally considered "Ground" or "Zero Volts", a fuse in the negative lead would leave the rest of the circuit "hot" - usually Not a Good Thing.
