Battery residual value calculation

What is the residual value calculation for EVs incorporating the actual battery condition?

The residual value calculation for EVs incorporating the actual battery condition is currently focused on fully electric vehicles, or BEVs for short (= battery electric vehicles). Hydrogen vehicles, mild hybrids and plug-in hybrids are not yet available.

How do you determine the residual value of a battery?

Battery appearance [7, 8], charge/discharge curves [, ,], open-circuit voltage [10, 11], capacity , and internal resistance [13, 14] are all typical methods for determining the residual value and categorizing batteries.

Why is a battery not suitable for a residual value assessment?

However, because they are external features of the battery, capturing its internal electrochemical state in depth is difficult, and obtaining features such as charge/discharge curves and capacity takes a long time, making them unsuitable for residual value assessment of large-scale RBs.

What is the residual value ratio of electric vehicles?

Li (2019) indicated that the residual values of BEV and GV are 9% and 16% of the vehicle production cost,respectively. Thus,it is assumed that the residual value ratio of GV,BEV,and FCV were 16%,9% and 9%,respectively. ... Are electric vehicles cost competitive? A case study for China based on a lifecycle assessment ...

How is a car battery value calculated?

When taking into consideration the battery condition, the vehicle value is calculated based on: Mileage: The number of kilometres on the clock plays a key role when correcting the value for the battery.

Which factors affect the residual value of a BEV?

technical improvement and cost reductionhave the greatest impact on the residual value of the BEV. 2) The residual rate of power battery is higher than that of v ehicle. Some scholars' p revious literature shows that the residual rate of power battery drops faster than that of vehicle. This study found that the
