

How to buy capacitors?

Learning how to buy capacitors can be complicated because the wrong choice can cause the circuit to not function properly. Dielectric Type - A major key on how to buy capacitors is checking the dielectric type. The dielectric determines size, package, frequency range and other electrical properties.

Are recent capacitors better than 1994-2002?

It appears that the trend is by now reversed, and recent capacitors are a bit better than the ones from 1994-2002. Can experts confirm it? Only a wild-arsed guess, so not an answer.

Why did cheap capacitors become a problem?

Presumably the cheaper manufacturers had missed something or cut some corners while reproducing (or ripping off) the Japanese research. The type of capacitor affected was cheap, large capacitance, low ESR capacitors. These are the kind of thing that appears in huge numbers of consumer devices, so the problem became known in the wider community.

Why is a large capacitor more expensive than a small capacitor?

Let's say you need a large amount of capacitance. A single large capacitor might be more expensive than several small ones that add up to the same amount. Filtering. Capacitors of different values have different impedance characteristics as a function of frequency.

Why do capacitors have different impedance characteristics?

Filtering. Capacitors of different values have different impedance characteristics as a function of frequency. If you're trying to filter out a range of frequencies (noise, EMI, etc), it's helpful to put a range of different capacitors next to each other to present low impedance to as much undesirable frequencies as possible.

Are old capacitors always better?

Capacitors vary wildly in failure modes due to ageing, and it is actually untrue that older designs were always better. Folks who repair vintage equipment will almost always replace certain capacitors without even testing them, and make sure they test others just to be sure.

If the capacitor is too small to provide that 100 mA for a significant period of time, it can't do much to you. I'd say about 1 mC is the minimum amount of charge that could possibly cause harm. So that would be 68 uF at 30F, 22 uF at 100V, or ...
