

Why do commercial solar panels typically have a shorter payback period than domestic ones? Commercial solar panels often have a shorter payback period because businesses face higher and uncapped electricity prices which allow for greater savings. They also typically use more energy during daylight hours when solar panels are most productive.

As an example, there are plenty of solar panels that only protrude a roof's structure by 200mm, reducing the visual impact of solar panels from roads or pathways. Properties that usually require planning permission for solar panels include leasehold premises (flats, apartments, commercial units etc), listed buildings and those located in conservation areas.
