

What is a DC capacitor?

A DC capacitor is a type of capacitor designed for DC use. It comes in various technologies. For instance, a 1000 V DC capacitor should not be used across the mains instead of a 250 VAC capacitor, as it may get damaged or catch fire after a mains voltage spike.

What is a DC link capacitor?

Figure 1 Half-bridge with high-side and low-side switches driving a brushed DC motor in PWM mode The input capacitor, also known as DCLINK capacitor, stabilizes the supply voltage and provides instantaneous current to the PWM operated half-bridge.

What should be considered when selecting a dclink capacitor?

When selecting a DCLINK capacitor, the ESR behavior versus temperature, in particular for cold temperatures, should be considered. In the example shown in Figure 9 the  $V_{Spp}$  voltage almost doubles at cold temperatures from 450mVpp to 800mVpp due to the increase of ESR at cold temperature.

What is the duty cycle of a dclink capacitor?

The duty cycle varied from 10% to 90%. The ESR of 65 mΩ for the DCLINK capacitor was determined by measurement in the lab. The capacitance of 330 μF is specified in the datasheet. Comments to the curve traces shown in Figure 8 : IMOTavg measured: In the used setup, the average motor current increases linearly with the duty cycle DC

What is the capacitance of a dclink capacitor?

A PWM frequency of 20 kHz was used. The duty cycle varied from 10% to 90%. The ESR of 65 mΩ for the DCLINK capacitor was determined by measurement in the lab. The capacitance of 330 μF is specified in the datasheet. Comments to the curve traces shown in Figure 8 :

What is a ceramic capacitor C11?

The ceramic capacitor C11 is a low impedance current source during the switching event when the high-side switch turns on and takes over the motor current. The current through the switch rises immediately from 0 to the value of  $IMOT_{avg} - 0.5 \times IMOT_{pp}$ , see Figure 2, waveform 3. The capacitor C11 reduces the emission into the VS supply line.
