

Do solar batteries work with solar panels?

Solar batteries are designed to work with solar panel systems. It's a device that stores the electricity you generate (but don't use immediately) from your solar panels, allowing you to then use that electricity later in the day.

What is a solar battery?

A solar battery is a storage device designed to hold onto the excess energy your solar panels generate throughout the day. You can use this extra energy at times when the sun isn't shining - such as evenings - or sell it to the grid through a solar export tariff.

Can solar panels work without batteries?

Yes, solar panels can operate without batteries. They generate electricity directly from sunlight and can power your home during the day. However, without batteries, excess energy generated on sunny days is wasted, and you won't have power available at night or during cloudy weather. What happens to excess energy from solar panels?

Does battery storage work with a solar panel system?

Adding battery storage to work in conjunction with a solar panel system allows you to use more of the renewable electricity generated and reduce reliance on the grid. For example, you could store electricity generated via your solar panels during the day to then use at night.

Should you use home batteries to store solar energy?

If you have solar PV panels, or are planning to install them, then using home batteries to store electricity you've generated will help you to maximise the amount of renewable energy you use. Storing your solar energy will reduce how much electricity you use from the grid, and cut your energy bills.

What type of battery does a solar panel use?

There are two main battery technologies currently used: lithium-ion and lead-acid. Both types are designed to handle the cyclic charging and discharging necessary for solar energy storage. When sunlight hits a solar panel, the solar cells convert it into direct current (DC) electricity.
