

Do battery energy storage systems have a problem of inconsistency?

Abstract: The grouping and large-scale of battery energy storage systems lead to the problem of inconsistency. Practical consistency evaluation is significant for the management, equalization and maintenance of the battery system. Various evaluation methods have been developed over the past decades to better assess battery pack consistency.

What is the purpose of evaluating battery pack consistency?

The final purpose of evaluating the battery pack consistency is to obtain its energy storage and power output capacity, that is, the maximum available energy E_{max} when the battery is fully charged and P_{max} at a specific SOC point.

How to determine battery pack consistency?

First, the capacity of each cell in the battery pack Q_i , the difference in remaining chargeable capacity of each cell when the battery pack reaches the charge cutoff condition Q_{di} , and the internal resistance of each cell R_i are determined to accurately characterize the battery pack consistency.

Why is consistency important in battery characterization?

Consistency is the main indicator for evaluating battery pack performance, and its characterization method needs to be able to express the external discharge capability of the battery pack and truly describe its current state without changes in external factors. Single-factor indicators cannot fully describe the battery state.

What causes battery pack inconsistency?

The battery pack inconsistency is affected by factors such as battery capacity, internal resistance, and self-discharge rate during use, resulting in differences in aging and SOC, causing secondary inconsistency. In recent years, many scholars have conducted extensive research on the inconsistency problem of lithium-ion battery packs.

How does a series battery pack affect SOCdiff?

However, when a series battery pack is charged, the current flowing through all cells is the same, that is, the amount of electricity DQ charged into all cells at the same time is the same, but the Q_i of each cell is different, so SOCdiff will change with the change of the battery pack SOC and cannot accurately describe its consistency.

As an effective way to solve the problem of air pollution, lithium-ion batteries are widely used in electric vehicles (EVs) and energy storage systems (EESs) in the recent years [1] the real applications, several hundreds of battery cells are connected in series to form a battery pack in order to meet the voltage and power requirements [2]. The aging of battery cells ...

Due to the initial and dynamic differences of battery cells, cell-to-cell capacity inconsistency exists in a battery pack. Considering the difference between the laboratory data and the operation data, this paper studies the battery pack capacity inconsistency of an electric vehicle based on cloud data.

The article systematically analyzes the influence of parameters variation on battery pack consistency based on the statistical distribution properties of the capacity, internal resistance and the SOC of a battery pack. It concludes that the SOC variation contributions the most to battery consistency from the perspective of energy utilization ...

The grouping and large-scale of battery energy storage systems lead to the problem of inconsistency. ... a battery pack consistency evaluation approach is proposed based on multi-feature ...

When the self-discharge of the battery is too large or the self-discharge consistency of the cells in the battery pack is poor, it will affect the cruising range of the new energy electric vehicle ...

In working condition of battery packs, the battery pack consistency has a great impact on the overall performance of the battery pack. In order to build an accurate battery pack model, we need to build a battery pack consistency model. Firstly, we used a Gaussian mixture model to fit the statistical characteristics of a single parameter. This method can accurately fit ...

The higher mileage reduces the pack consistency, as the battery's performance evolves into multiple clusters. Nine months later, the pack consistency is reduced by about 0.331%. ... Degradation model and cycle life prediction for lithium-ion battery used in hybrid energy storage system. Energy, 166 (2019), pp. 796-806. [View PDF](#) [View article](#) ...

Study on battery pack consistency evolutions and equilibrium diagnosis for serial-connected lithium-ion batteries. Appl. Energy, 207 (2017), ... Battery energy storage system modeling: a combined comprehensive approach. J. Energy Storage, 21 (2019), pp. 172-185, 10.1016/j.est.2018.11.012.

battery pack consistency were extracted. Finally, based on such characteristics, the consistency analysis of the energy storage power station was divided into two levels, and the consistency analysis algorithm was proposed for large-scale battery packs in the station.

Battery consistency is an important concept in the field of battery technology, and it is significant for various applications such as electric vehicles and energy storage systems. Battery consistency refers to the uniformity of individual batteries in terms of initial performance indicators when used in packs.

The final purpose of evaluating the battery pack consistency is to obtain its energy storage and power output capacity, that is, the maximum available energy E_{max} when the battery is fully charged and P_{max} at a specific SOC point. Concerning the consistency evaluation of battery packs, the first problem is how to characterize the consistency of the battery pack.
