

What is a safety capacitor?

Safety capacitors are also called EMI /RFI suppression capacitors,AC line filter safety capacitors,or X- and Y-rated capacitors. X and Y capacitors not only keep radio frequency noise generated by the device local to that device,but also protect the device from mains noise and high voltage surges.

What is a line filter safety capacitor?

Line filter safety capacitors can improve the reliability, safety and performance (sound) of your vintage tube radio.

What voltage is a safety capacitor?

With a working voltage of 400 VAC in line-to-line (Class X) and 250 VAC in line-to-ground (Class Y) applications,these safety capacitors meet the impulse test criteria outlined in IEC Standard 60384. Meeting subclass X1 and Y1 requirements,these devices are certified to withstand impulses up to 4 KV (X1) and 8 KV (Y1) respectively.

What is an AC line filter capacitor?

The capacitors that filter out interference from the 110-120 volt AC (alternating current) power coming from your wall plug go by a number of names. The general term for these capacitors is AC Line Filter Capacitor or AC Interference Suppression Capacitor.

Do tube radios need line filter safety capacitors?

If tube radios were manufactured today in 2004,AC rated line filter safety capacitors would be required. The capacitors that filter out interference from the 110-120 volt AC (alternating current) power coming from your wall plug go by a number of names.

What is a filter capacitor?

Filter capacitors are capacitors used for filtering of undesirable frequencies,they are common on domestic equipment inputs to help reduce unwanted clicks and hums. Sinequanon stock a useful range of common suppressor and filter capacitors.

All Vishay through-hole ceramic safety capacitor series offer a variety of lead wire materials, lead spaces, lead design, and packages. Customized solutions are available upon request. All safety capacitors are approved according to IEC 60384-14.4, UL, and CQC, while all series are compliant with RoHS and the REACH regulations.

I'm putting together a tube rectified power supply (for a power amp) which uses a 5U4G rectifier. The GE 5U4 data sheet lists (under typical operating characteristics) an input filter capacitor of 40 mfd. They don't list a maximum value. Mainly my question is, can a larger value cap be used in this location?

Electrolytic (and other type) filter capacitors can hold lethal charges - be sure to discharge them before working on an amplifier. This can be done by shorting the "+" side to the "-" side, or the "+" side to the chassis (unless the cap is in a negative voltage supply, like the bias supply, where you must short the "-" side to the chassis), using a wire or a screwdriver.
