Gabon low voltage capacitor installation

Why do you need a capacitor bank?
It helps you to shape up your technical skills in your everyday life as an electrical engineer. In an low voltage electrical installation,capacitor banks can be installed at three different levels - global,segment (or group) and individual.

What is a power factor correction capacitor?
In this manner the network avoids distributing the reactive power absorbed by load. Individual power factor correction capacitors reduce additional losses caused by cable and transformer coil heating, and allows for the installation of smaller sized wire.

What is segment installation of capacitors?
Segment (or group) installation Segment installation of capacitors assumes compensation of a loads segment supplied by the same switchgear. Capacitor bank is usually controlled by the microprocessor based device called power factor regulator. Beside,segment installation practice demands protection for capacitor banks.

What are the disadvantages of a capacitor bank compensation method?
This type of compensation method demands capacitor banks to have wide range of power regulation,which can be determined by 24h measurements at the place of installation of the circuit breaker. What's good in this solution //But,the downsides are : The losses in the cables (RI 2) are not reduced.

How do you maintain a capacitor?
Control the service voltage (especially during moments of low charge, it must not exceed the nominal +10%). Maintain the capacitor terminals clean. Verify the state of the contacts of operating elements.

How do I connect the earth cable to a capacitor bank?
Connect the earth cable to the capacitor bank's earth terminal located on the equipment operating panel. The cable size will be selected in accordance with the admissible current limits established in the REBT (ITC-BT-19 - Internal or receiver installations) for each type of cable and their location.

In order to protect capacitors against harmon-ics, the installation of a detuning reactor in se-ries with the capacitor is strongly recommend-ed. This reactor will increase the impedance for the high frequencies and will limit the current flowing into the capacitor. We usually protect the capacitor from the 3rd harmonic upwards
