

Guatemala s new energy battery cascade utilization

Why is Cascade utilization of power batteries important?

The cascade utilization of power batteries holds tremendous potential and serves as an effective means to address energy and environmental challenges, driving sustainable development.

Are enterprises involved in the Cascade utilization of power batteries?

Our study focuses on enterprises involved in the cascade utilization of power batteries, examining the timing and pros and cons of government EPR policy implementation, as well as optimal pricing decisions for supply chain members. The findings provide valuable insights for the operations of relevant enterprises and government regulatory design.

What applications can cascade power be used for?

Based on an estimated residual capacity of 70-80% when retired from new energy vehicle power modules, potential application areas for cascade utilization include power sources for electric bicycles, tour buses, and fixed energy storage scenarios that meet energy density requirements.

What are the environmental benefits of a cascade battery?

For LFP battery, the cascade utilization technology exhibited the highest environmental net benefits, reducing acidic gas emissions of 0.77 kg SO₂ eq. The recycled product was the cascade battery pack, which minimized the total AP index value.

What is Cascade utilization & disassembly recycling?

Cascade utilization and disassembly recycling technology are two main ways to recycle power batteries. Specifically, cascade utilization refers to the application of decommissioned power batteries to other scenarios to extend the life of the battery and maximize the life cycle value of lithium-ion batteries (Wang et al., 2022).

How Pyro-Hydro combined utilization of NCM batteries affect the environment?

Research results indicated that the pyro-hydro combined utilization process of NCM batteries exhibited the most significant positive environmental impact, and the cascade utilization, pyrometallurgy, and hydrometallurgy technology also showed beneficial environmental effect.

For LFP battery, the cascade utilization technology exhibited the highest environmental net benefits, reducing acidic gas emissions of 0.77 kg SO₂ eq. The recycled ...

However, the cascade utilization of power batteries could alleviate recycling pressure and environmental pollution while maximizing the full life cycle of the battery, ...

closed-loop supply chain, the system decision-making problem of the power battery dual ...

Considering the effective utilization of power battery, the cascade utilization was introduced power battery closed-loop supply chain, the system decision-making ...

Battery Cascade Utilization under Government Subsidies . Yue Guan . 1, Tian-hui He . 2 ... The continued industrialization of new-energy vehicles has facilitated the rapid growth of the

By establishing the cascade utilization model, Fan et al. improved the prediction accuracy of new energy and the revenue of retired batteries. The moving average method ...

New energy vehicle (NEV) power batteries are experiencing a significant "retirement wave", making second-life utilization (SLU) a crucial strategy to extend their lifespan and maximize their inherent value. This study focuses on prominent enterprises in China's SLU sector, including BAIC Group, BYD, China Tower, and Zhongtian Hongli. Employing a multi ...

This paper reviews the key issues in the cascade utilization process of retired lithium batteries at the present stage. It focuses on the development status and existing challenges of residual capacity estimation methods and consistency sorting technology.

The proposed system provides an energy management method for various types of an energy storage system including cascade utilization battery. The method is used to receive, store and manage the relevant operating data from the energy storage battery and also randomly determine the energy distribution coefficient of the energy storage battery.

Subsequently, in the model that incorporates cascading utilization by the storage facility (S), illustrated in Fig. 2b, the decision variable for the energy storage stations is the market-set electricity price ($p_{\{e\}}$), while the battery manufacturer's decision variables include the unit wholesale price of a new battery ($p_{\{n\}}$), the unit recycling price of waste battery ($b_{\{t\}}$), and ...
