

Are perovskite solar cells a good investment?

Perovskites produce very high efficiency solar cells, which has led research into perovskite solar cells becoming very popular over the past few years. Currently the record efficiency is around 22%, which is incredible for a field which is still less than 10 years old.

How are perovskite solar cells made?

Perovskite solar cells can be manufactured using conventional n-i-p or p-i-n architecture, sandwiching the perovskite absorber layer between a Hole Transporting Layer (HTL) and an Electron Transporting Layer (ETL). The order of these layers varies with the architecture of the cell.

What is a sensitized perovskite solar cell?

Schematic of a sensitized perovskite solar cell in which the active layer consists of a layer of mesoporous TiO₂ which is coated with the perovskite absorber. The active layer is contacted with an n-type material for electron extraction and a p-type material for hole extraction. b) Schematic of a thin-film perovskite solar cell.

How efficient are perovskite-silicon tandem solar cells?

Perovskite-silicon tandem cells have reached efficiencies of almost 34%. While perovskite solar cells have become highly efficient in a very short time, perovskite PV is not yet manufactured at scale and a number of challenges must be addressed before perovskites can become a competitive commercial PV technology.

What is the difference between a photovoltaic and a perovskite solar cell?

Conventional photovoltaics are typically made from Si and 25.1% power conversion efficiency was reported for thin-film Si-crystals. Perovskite solar cells (PSCs) derived their name from the light-harvesting layer within the device which is made of perovskite-structured compounds.

What is a mesoporous perovskite solar cell?

Mesoporous perovskite solar cell (n-i-p) The Mesoporous Perovskite Solar Cells (MPSCs) have recently drawn greater interest due to their inexpensive components, simple manufacturing process, and high PCE. In MPSC, a fluorine-doped tin oxide layer (FTO), which typically blocks holes and collects electrons, is placed before the compact layer.
