

How to connect lithium battery with excessive current

Can you mix different capacity lithium batteries?

Yes, you can mix different capacity lithium batteries, whether a normal 12V 100Ah battery or a Lithium server rack battery. You can combine different capacity batteries in parallel. You cannot combine different capacity batteries in series. There are a few points you need to consider when wiring in parallel. Let's explore these three points.

How are lithium ion / lithium polymer batteries charged?

Lithium Ion /Lithium Polymer batteries are usually charged in two stages- first a constant current (CC) mode where the current is by design limited by the charger and then a constant voltage (CV) mode where the current is limited by the battery. The maximum current allowed in CC mode for a given battery is set by the battery manufacturer.

Can you connect lithium batteries in parallel?

Ensure that the lithium batteries you intend to connect in parallel have the same voltage and SOC. Mixing batteries with different specifications can lead to imbalanced charging and discharging, which is unsafe. Batteries that are at different SOC should be charged or discharged to within 0.25 volts to prevent damage due to excessive current.

Can a lithium-ion Charger damage a battery?

Connecting a higher-current power supply to a lithium-ion charger will damage the battery. Why? I am not asking how the battery gets damaged, because that answer is straightforward. What I am asking is why lithium-ion chargers allow batteries to be damaged by excessive charge current in the first place.

How does a lithium polymer battery charger work?

For a lithium polymer battery the charger limits both the voltage and current into the battery, with voltage limit set to something like 4.0 to 4.2V and the current limit to a 1C rate at most, for a 1 hour charge. Likely somewhat slower in order to do as little damage to the battery as possible while giving the user an acceptably fast charge time.

What happens if you put two lithium batteries in a water tank?

The pressure remains the same, but you now have double the water. Same as the water tanks, let's consider you have lithium batteries, each with 12 volts and 100 amp hours. Connect two lithium batteries with 12 volts in parallel, and the total voltage is still 12 volts, but the total capacity jumps to 200 amp hours.
