

How to connect the booster pump to the capacitor line

Will a booster pump work if I plug in electricity?

Note: The Booster Pump assembly will not work when you plug in the electricity, as the high pressure switch is hooked up to prevent the pump from running dry. You have to connect the pump into your Reverse Osmosis system and connect the water to your system and apply the proper pressure.

How do you tighten a booster pump?

Hand-tighten the fitting counter-clockwise (about 5 to 6 rounds). CAUTION: Overtightening may damage the fitting or case threads and can cause leaking. Note: The Booster Pump should be installed either horizontally or vertically with the head facing down in order to protect the booster coil from getting damaged from water spills.

Where should a booster pump be installed?

Note: The Booster Pump should be installed either horizontally or vertically with the head facing down in order to protect the booster coil from getting damaged from water spills. High-pressure Switch: Has two 1/4" OD tube ports and can be connected in either direction.

Why is my booster pump not working?

Solenoid Valve (optional): Normally Off when there is no power (if tank is full or no incoming water pressure). It may feel a bit warm when it is engaged, this is normal. Note: The Booster Pump assembly will not work when you plug in the electricity, as the high pressure switch is hooked up to prevent the pump from running dry.

What is a PL-VSTM booster pump?

The Series PL-VSTM Booster Pump is a pump designed to be used for water circulating applications in hydronic heating, solar systems, and chilled water systems. It can be adjusted manually or by a 4-20 mA or 0-10VDC control input. These pumps are designed to pump liquids compatible with their iron or bronze body construction.

How do I install a TM Booster Pump?

To install a TM Booster Pump, locate the pump with sufficient room for inspection, maintenance, and service. Bell & Gossett recommends installing service valves on the suction and discharge of the pump to facilitate servicing or replacement without draining the system. Install suction and discharge flanges on the pipe ends.

SINGLE STAGE BOOSTER PUMPS WITH PRESSURE SWITCH. CPM158 Booster Pump. Range of performance. Flow rate: Max 100 L/min. Head: Max 19m ... capacitor and thermal ...
