What happens if a chassis battery is overcharged?

To prevent overcharging when connected to shore power for long periods of time, the system monitors the battery voltage and when it exceeds 13.8 volts for one hour, the chassis battery will be disconnected. When the voltage on that battery drops below 12.6 volts, the isolator will reconnect to recharge the battery.

How do I know if my chassis battery is draining?

Chassis battery continues to drain. The isolator relay is not closing. Check for voltage on coil terminals of isolator relay (should be approximately 4 volts). Operate the engine at a high idle for at least 20 seconds and check the chassis battery voltage. It must be at least 13.3 volts. If it less, check alternator.
