

# How to modify the power supply for battery heating

How do I connect a battery to a power supply?

Your power supply will need to be 13V2 to 13V8\*, just put it in parallel with the battery and the load. Add a buck converter to get whatever lower voltages you need. You MUST put a fuse in one of the leads to the battery, as physically close to the battery as possible.

Which power supply should be used to charge a battery?

Default supply should be provided by an external power supply(1). In parallel, the connected power supply should charge the permanently installed battery (4) via a DC converter (2) followed by charge controller/BMS (3) - depending on the applied accumulator technology. So the battery should be constantly fully charged.

How do I enable battery heating?

Setting path: Main -> Settings -> Advance Setting -> Battery Heating-> Func Select Enable it and set heating periods. Hardware version:

Can Battery Self-heating technology improve power supply capacity of lithium-ion batteries?

Battery self-heating technology has emerged as a promising approach to enhance the power supply capability of lithium-ion batteries at low temperatures. However, in existing studies, the design of the heater circuit and the heating algorithm are typically considered separately, which compromises the heating performance.

What is the heating power per module?

The heating power per module is 180W for T30 battery, and 120W for HS25/HS36 battery. Please check the heating wires are correctly connected, or the heating function will not take effect. The heating control is based on the Cell temperature, which is the internal temperature rather than the environment temperature.

How do you calculate the increased available energy of a battery?

The increased available energy is calculated as  $\Delta E = SOC_1 f_1(T_1) - SOC_0 f_1(T_0)$  where  $SOC_0, SOC_1$  denote the initial and final SOC respectively, and  $T_0, T_1$  denote the initial temperature and final temperature of the battery respectively. Table 1.
