This means that it is either a capacitor start or a capacitor run motor. A capacitor start has two sets of windings. It applies the caps in series (or parallel I can't remember) with the windings to make a phase difference between the two coils to overcome the zero speed condition. After that it switches back to run off of the field in the motor.

Replacing the Capacitor. Replacing a capacitor in an exhaust fan is a relatively simple task for those with basic electrical knowledge. However, it is crucial to ensure that the replacement capacitor has the same capacitance value and voltage rating as the original. Safety Precautions.
