This next generation of parabolic trough collectors is capable for various applications in the temperature range of 200-400 °C, appropriate for electricity generation, desalination and process heat applications, delivering energy from a few Mega Watts up to hundreds of Mega Watts.

In Guangzhou, the CPC-PV/T has the least annual operating hours, and solar power generation accounts for the lowest percentage of the total power generation, only 2.76%. It can be seen that with the increase of the annual solar radiation intensity, the proportion of solar power generation and steam production in the total output is increasing.

Considering that fossil fuels are used as a source of heat and are running out, the use of renewable energy, especially solar energy for thermal applications, is a good suggestion. 4,5 Solar energy is used for several reasons, including the low economic cost, the simplicity of its system design, and the compatibility with the environment. 6,7 The idea of using solar ...

These solar collectors shine in big solar power plants. They help by turning heat into steam. The steam drives turbines to create electricity. This method, called concentrated ...
