How do battery energy storage systems make money?

Battery energy storage systems in Great Britain earn revenue through a variety of markets with different mechanisms. The revenue stack for batteries has shifted away from ancillary services towards merchant markets. But what are the main markets, how do they operate, and how will prices develop over time?

What is the biggest revenue stream for battery energy storage?

Trading power on the wholesale market has become the largest revenue stream for battery energy storage. Over the lifetime of a battery built today, we forecast wholesale trading to represent 67% of total revenues. Batteries profit from the spread between their charge and discharge prices.

How has the battery revenue stack changed?

Joe looks at how the battery revenue stack has changed. Batteries maximize revenues by performing actions across multiple markets, 'stacking' revenues from each. These markets and corresponding actions occur across different time horizons. Some operate years out, such as for the Capacity Market. Others occur within the day or even in real-time.

What happened to battery energy storage in Great Britain in 2024?

2024 was a pivotal year for battery energy storage in Great Britain. Batteries began the year with their lowest revenues on record and ended with their highest revenues in two years. It followed 2023, a year where buildout reached record highs and frequency response services saturated, leading to an evolved revenue stack.

How much do batteries earn from wholesale trading?

Over the lifetime of a battery built today, we forecast wholesale trading to represent 67% of total revenues. Batteries profit from the spread between their charge and discharge prices. Price spreads, measured as the difference between the maximum and minimum price each day, largely determine the value batteries can earn from trading.

How much does a battery cost?

The cost of battery cells, for instance, decreased from above US\$1,100/kWh in 2010 to less than US\$156/kWh in 2019 (BNEF, 2019). Repeating our review with papers from 2017 to 2019 only, we find the conclusion to improve markedly, as shown in Figure S2 in the Supplemental Information. Of the 19 examined business models 14 are now green.
