

What is a liquid immersion cooling battery pack?

A liquid immersion cooling battery pack containing 60 batteries were established. At 2C discharge rate, 0.5 L/min flow rate was recommended. The battery pack can address localized high-rate discharge events (4.5C or 6.5C). Liquid immersion cooling BTMSs have great heat dissipation performance.

How to design a liquid cooling battery pack system?

In order to design a liquid cooling battery pack system that meets development requirements, a systematic design method is required. It includes below six steps. 1) Design input (determining the flow rate, battery heating power, and module layout in the battery pack, etc.);

What are liquid cooled battery packs?

Liquid-cooled battery packs have been identified as one of the most efficient and cost effective solutions to overcome these issues caused by both low temperatures and high temperatures.

What are the development requirements of battery pack liquid cooling system?

The development content and requirements of the battery pack liquid cooling system include: 1) Study the manufacturing process of different liquid cooling plates, and compare the advantages and disadvantages, costs and scope of application;

Why is indirect liquid cooling used in power battery pack?

Considering that the indirect liquid cooling method is adopted in this power battery pack, the natural convection heat transfer between the battery and the external environment and the radiation heat transfer (which contributes to a small proportion) can be neglected.

Can liquid cooling improve battery performance?

One way to control rises in temperature (whether environmental or generated by the battery itself) is with liquid cooling, an effective thermal management strategy that extends battery pack service life. To study liquid cooling in a battery and optimize thermal management, engineers can use multiphysics simulation.
