

Are lithium-ion battery materials a viable alternative?

Rare and/or expensive battery materials are unsuitable for widespread practical application, and an alternative has to be found for the currently prevalent lithium-ion battery technology. In this review article, we discuss the current state-of-the-art of battery materials from a perspective that focuses on the renewable energy market pull.

What are the components of a battery?

Battery components Generally speaking, a battery consists of five major components. An anode, cathode, the current collectors these may sit on, electrolyte and separator, as shown in Fig. 2. Fig. 2. A typical cell format. Charging processes are indicated in green, and discharging processes are indicated in red.

What are the components of a Li-ion battery?

The essential components of a Li-ion battery include an anode (negative electrode), cathode (positive electrode), separator, and electrolyte, each of which can be made from various materials. 1.

Why are aromatic compounds important in lithium-ion batteries?

Ever since lithium-ion batteries (LIBs) were successfully commercialized, aromatic compounds have attended every turning point in optimizing electrolytes, separators, and even electrode materials. However, the contribution of aromatic compounds has always been neglected compared to other advanced materials.

What types of batteries are used?

The most studied batteries of this type is the Zinc-air and Li-air battery. Other metals have been used, such as Mg and Al, but these are only known as primary cells, and so are beyond the scope of this article.

Is there a fully developed battery using metallic sodium?

A fully developed battery using metallic sodium does exist in the form of Na/S batteries. The Na/S system traditionally uses a solid beta-alumina electrolyte and operates at a temperature of between 300 and 350 °C.

Similar to all other batteries, it also has four components: Al foil as anode; graphitic materials, metal sulfides and selenides, spinel compounds, and organic macrocyclic compounds considered as a cathode material which are coated onto some stable current collector (Mo, Ta, Nb, etc.) to improve the electronic conduction between two electrodes; separator with ...
