What voltage should a lithium battery have?

Don't allow the battery voltage to drop below 3.0V as it can damage the battery. Lithium batteries will often have a specified maximum discharge current of say 2C, which means 2x their mAh rating. For example a 120mAh battery with a 2C max discharge current would only allow you to draw up to 240mA continuous operating current.

What are the key technical parameters of lithium batteries?

Learn about the key technical parameters of lithium batteries, including capacity, voltage, discharge rate, and safety, to optimize performance and enhance the reliability of energy storage systems. Lithium batteries play a crucial role in energy storage systems, providing stable and reliable energy for the entire system.

What is the energy density of a lithium ion battery?

Energy density is often a more relevant indicator than capacity in practical applications. Current lithium-ion battery technology achieves energy densities of approximately 100 to 200 Wh/kg. This level is relatively low and poses challenges in various applications, particularly in electric vehicles where both weight and volume are restricted.

What is the maximum charge rate for a battery?

If a battery has a maximum discharge rate of 10C for 10 seconds and a maximum charge rate of 5C for 10 seconds, it can discharge at a current of 200A for 10 seconds and charge at a current of 100A for the same duration.

Why are lithium batteries important for energy storage systems?

Lithium batteries play a crucial role in energy storage systems, providing stable and reliable energy for the entire system. Understanding the key technical parameters of lithium batteries not only helps us grasp their performance characteristics but also enhances the overall efficiency of energy storage systems.

Do lithium batteries have a datasheet?

Generally: No datasheet, no sale. It's really as simple. But, really, usually lithium batteries have their voltage, their nominal capacity and the maximum sustained discharge current printed right on them or very prominently mentioned in a datasheet. Also, you mixed up "Ah" and "A" in your link description.

After a lot of research and experimentation I have come to learn that the sentence "This is a 1.5 V, 2800 mAh battery" is entirely a lie. (i.e., the potential difference between the terminals of a battery changes over time and the shape of the graph is dependent on battery chemistry, ambient temperature and current draw, as is the useful energy capacity.
