

Are OPV-based photovoltaic cells based on light intensity?

Considering that indoor light photovoltaic cells and photodetectors operate under vastly different light intensity regimes compared with outdoor solar cells, a comprehensive understanding of the intensity dependence of charge collection (over a very broad range of intensities) is needed to chart the full potential of OPV-based technologies.

Does exciton diffusion increase power conversion efficiency in organic photovoltaic cells?

Energy Environ. Sci. 2015; 8: 1867-1888 Tailored exciton diffusion in organic photovoltaic cells for enhanced power conversion efficiency. Correlation of hole mobility, exciton diffusion length, and solar cell characteristics in phthalocyanine/fullerene organic solar cells. Triplet harvesting in hybrid white organic light-emitting diodes.

Does surface recombination velocity affect diffusion length in PERC solar cells?

As the surface recombination velocities become higher (>6000 cm/sec) (Fig. 9), the effective diffusion lengths for PERC, Mono, and Multi solar cells become almost identical, indicating that both sides of passivation in PERC solar cells play a crucial role for higher diffusion length/minority carrier lifetimes in these solar cells. 4.8.

How does recombination affect the performance of organic photovoltaic devices?

The competition between recombination and extraction of carriers defines the charge collection efficiency and, therefore, the overall performance of organic photovoltaic devices, including solar cells and photodetectors.

Does photo-induced space charge affect the performance of organic solar cells?

The influence of Photo-induced space charge and Energetic Disorder on the indoor and outdoor performance of organic solar cells. Tail state limited photocurrent collection of thick photoactive layers in organic solar cells. Modeling photocurrent action spectra of photovoltaic devices based on organic thin films.

Does surface passivation affect diffusion length?

The effect of surface passivation on the diffusion length has also been studied for mono, multi, and PERC crystalline solar cells. The results indicate that the PERC solar cells have a higher L and lower d_l value and the probable reason for the high performance of this technology.

To this end, current-voltage characteristics of small-area all-perovskite tandem solar cells are obtained for dark and illuminated cases from a calibrated optoelectronic device ...

The PV cell with six consecutive layers of BFO and BTO exhibited the improved PV response characteristics

($V_{oc} = 1.806 \text{ V}$ and $J_{sc} = 17.76 \text{ mA/cm}^2$), in comparison to the other prepared multilayer PV cells. In order to further enhance the PV characteristics, it was important to improve the quality of BTO and BFO thin films.

Comparison of solar cell diffusion current-voltage characteristics predicted by the simplified and present models. "Thin" and "thick" refer to HTL & ETL with...

Among the most rapidly developed solar cells belonging to the so-called third-generation photovoltaics, organic photovoltaics exhibit a variety of advantages including their lightweight, flexibility, transparency, great variety of chemical compositions, and high efficiencies that, eventually, allow the fabrication of organic solar cells (OSCs) by printing on lightweight ...

The purpose of this paper is to discuss the different generations of photovoltaic cells and current research directions focusing on their development and manufacturing technologies.

Because a S_{eff} of lower than 50 cm/s is required to achieve high PCE of c-Si solar cells with a surface structure, the decreased S_{eff} value would be a cornerstone ...

The thin-film PV cells such as organic photovoltaic cells (OPVs), consume less material comparative to Si-based cells and can be fabricated by using the low-cost solution processing techniques, consequently lowering the cost per unit watt power [8,9,10]. In today's industry and academic research field, the OPVs have emerged as one of the most promising alternatives to ...

Employing sunlight to produce electrical energy has been demonstrated to be one of the most promising solutions to the world's energy crisis. The device to convert solar ...

The fundamental philosophy of improved PV cells is light trapping, wherein the surface of the cell absorbs incoming light in a semiconductor, improving absorption over several passes due to the layered surface structure of silica-based PV cells, reflecting sunlight from the silicon layer to the cell surfaces [36]. Each cell contains a p-n junction comprising two different ...

A solar cell, also known as a photovoltaic cell (PV cell), is an electronic device that converts the energy of light directly into electricity by means of the photovoltaic effect. [1] It is a form ...

Resulting local series resistance and local recombination current images are compared among different methods as well as to global values extracted from the current-voltage characteristics of the...
