

What is a typical solar home system?

Schematic diagram of a typical Solar Home System. [...] ... classic SHS is composed of battery for the storage of energy, load for the consumption of power and solar panel as a source. The most common schematic view of SHS that has been accepted though out the world and especially in South Asian Countries is shown in Fig.1.

How do solar panels create a usable electricity system?

Here's how solar arrays create a usable electricity system for your home: As we've explained, the solar cells that make up each solar panel do most of the heavy lifting. Through the photovoltaic effect, your solar panels produce a one-directional electrical current, called direct current (DC) electricity.

How do solar panels work?

Silicon is used to create solar cells, which are the components in solar panels that convert sunlight into electricity. These solar cells are usually arranged in a grid-like pattern on the surface of the panel and are protected by a glass casing for durability and longevity. Solar panels operate on a principle known as the photovoltaic (PV) effect.

What is the photovoltaic effect?

The photovoltaic effect is a process that generates voltage or electric current in a photovoltaic cell when it is exposed to sunlight. It is this effect that makes solar panels useful, as it is how the cells within the panel convert sunlight to electrical energy. The photovoltaic effect was first discovered in 1839 by Edmond Becquerel.

Where does the photovoltaic effect occur?

The photovoltaic effect occurs in solar cells. These solar cells are composed of two different types of semiconductors - a p-type and an n-type - that are joined together to create a p-n junction. To read the background on what these semiconductors are and what the junction is, [click here](#).

How do solar panels convert sunlight into electricity?

The process of converting sunlight into electricity begins with the absorption of photons (light particles) by solar cells. This absorption creates an electrical current as electrons are displaced. The current then flows through the electrical circuit built into the solar panel.
