

How does a solar cell control device work?

In control devices with metal electrodes, the highly mobile I⁻ and metals migrate all over the solar cell's layers after operating the device for 1,000 h. This is in striking contrast to the case with composite electrodes, where the I⁻ and metals are almost confined to their initial position after the same operating time.

Are electrodes used in perovskite solar cells?

This review aims to summarize the significant research work carried out in recent years and provide an extensive overview of the electrodes used till date in perovskite solar cells. We present a critical survey of the recent progress on the aspect of electrodes to be used in perovskite solar cells.

How to choose a solar cell electrode?

Effects such as diffusion of elements from the electrodes to the internal layers, obstruction to moisture and oxygen, proper adhesion, and resistance to corrosion should also be taken under consideration. The choice of the electrodes also depends on the ETL or HTL materials used in the solar cells.

Can a composite electrode improve the operational stability of perovskite solar cells?

Now, researchers have developed a composite electrode consisting of Cu-Ni alloy sandwiched between graphene layers to considerably improve the operational stability of perovskite solar cells. Perovskite solar cells, emerging as a promising photovoltaic technology, have demonstrated impressive power conversion efficiency exceeding 25% [1].

Which electrode material is best for inverted hybrid solar cells?

The electrodes made of Al and Ag show higher output power compared to the device made of Au electrode. These experimental data lead to the conclusion that Ag is the optimal top electrode material for use in inverted devices. Thus, electrodes made of Ag are relatively a better option for the back electrode in inverted hybrid solar cells.

Does a flat electrode based solar cell increase PCE?

The enhancement in current density has resulted in an enhanced initial PCE of 9.9% when compared between the flat electrode-based solar cells and the solar cells based on the nanophotonic front electrode (9.6) (Fig. 7), respectively.
