Are battery management systems a cybersecurity threat?

The increasing use of renewable energy and electric vehicles has led to the widespread adoption of battery management systems (BMS) in energy storage. As BMS becomes more advanced and also becomes more vulnerable to cyber threats. This research paper presents an analysis of the challenges and solutions for enhancing the cybersecurity of BMS.

What is battery Authentication Architecture?

The presented battery authentication architectures meet the counterfeit battery challenges to protect OEM businesses and to promote end-user safety and satisfaction. Several authentication schemes currently are used to identify that a battery pack is intended for specific portable products. The most common is the form factor or physical connection.

Why is a battery energy storage system important?

Battery energy storage system (BESS) is an important component of a modern power system since it allows seamless integration of renewable energy sources (RES) into the grid. A BESS is vulnerable to various cyber threats that may influence its proper operation, which in turn impacts negatively the BESS and the electric grid.

How to choose battery authentication scheme?

The selection of the battery authentication scheme between the simple ID authentication and SHA-1/HMAC-based authentication depends on the security level needed and cost for the applications. The simple ID authentication is the least expensive and is good for cost-sensitive applications, but it is easy to replicate.

Can mL and AI support cyber defense of battery systems?

We discuss how ML and AI-based methods can support cyber defense of battery systems. Battery energy storage system (BESS) is an important component of a modern power system since it allows seamless integration of renewable energy sources (RES) into the grid.

Is encryption necessary for a CBMS?

Moreover, encryption is useless in the case of specific attack types against CBMS such as random delay attacks. User authentication and access control [90, 91]: User authentication provides an additional layer of security against unauthorized access to the battery, CBMS, and related data.

Cyber surveillance systems can deter unauthorised access and mitigate the risk of malicious interference. Additionally, deploying advanced encryption and authentication mechanisms within battery management ...
