

What is the energy storage capacity of aluminium?

Energy storage capacity of aluminium Aluminium has a high storage density. Theoretically, 8.7kWh of heat and electricity can be produced from 1kg of Al, which is in the range of heating oil, and on a volumetric base (23.5MWh/m³) even surpasses the energy density of heating oil by a factor of two. 4.2. The Power-to-Al process

When will aluminium be used for energy storage?

Although it is possible that first systems for seasonal energy storage with aluminium may run as early as 2022, a large scale application is more likely from the year 2030 onward.

What is the energy density of aluminium?

Aluminium can be used to produce hydrogen and heat in reactions that yield 0.11kg H₂ and, depending on the reaction, 4.2-4.3kWh of heat per kg Al. Thus, the volumetric energy density of Al (23.5MWh/m³) 1 outperforms the energy density of hydrogen or hydrocarbons, including heating oil, by a factor of two (Fig. 3).

Can aluminium be used for low and zero energy buildings?

Dudita M, Farchado M, Englert A, Carbonell D, Haller M. Heat and power storage using aluminium for low and zero energy buildings. In: Proceedings CLIMA 2019 -13th REHVA World Congress, Bucharest, Romania: 2019, p. 1-6, accepted for publication. US DOE. Fuel Cell Technologies Market Report 2015. 2016.

Can aluminium redox cycles be used for energy storage?

Aluminium redox cycles are promising candidates for seasonal energy storage. Energy that is stored chemically in Al may reach 23.5MWh/m³. Power-to-Al can be used for storing solar or other renewable energy in aluminium. Hydrogen and heat can be produced at low temperatures from aluminium and water.
