

What is the working principle of a solar cell?

Working Principle: The solar cell working principle involves converting light energy into electrical energy by separating light-induced charge carriers within a semiconductor. Role of Semiconductors: Semiconductors like silicon are crucial because their properties can be modified to create free electrons or holes that carry electric current.

How do solar cells work?

Working Principle: The working of solar cells involves light photons creating electron-hole pairs at the p-n junction, generating a voltage capable of driving a current across a connected load.

What is a solar cell?

A solar cell (also known as a photovoltaic cell or PV cell) is defined as an electrical device that converts light energy into electrical energy through the photovoltaic effect. A solar cell is basically a p-n junction diode.

What is the working principle of a photovoltaic cell?

Working principle of Photovoltaic Cell is similar to that of a diode. In PV cell, when light whose energy ($h\nu$) is greater than the band gap of the semiconductor used, the light gets trapped and used to produce current.

What is a solar cell & a photovoltaic cell?

Solar Cell Definition: A solar cell (also known as a photovoltaic cell) is an electrical device that transforms light energy directly into electrical energy using the photovoltaic effect.

How do solar cells convert sunlight into electrical energy?

Solar cells convert sunlight into electrical energy through the photovoltaic effect. They are constructed of layers of n-type and p-type semiconductors that form a p-n junction. When sunlight is absorbed, electrons are released and produce an external DC current.
